Staff information display module

A web solution for private information display

VISTA WEB is a solution that provides detailed flight information to people working at the airport through a web interface:

- ≡ handling agents (baggage, runway operations, passengers, ground handlers, etc.),
- ≡ airlines,
- ≡ certain airport services (information desks, operators, police, customs, etc.),
- ≡ staff located at certain external sites (hotels, etc.).

Authorized users can access this information on any workstation (either dedicated and secure front-office or standard back-office) equipped with an intranet/Internet browser.

User-friendly tool

Like all other software developed by RESA, VISTA WEB provides a highly user-friendly and ergonomic interface for users and for the administrator in charge of settings definition (frequency of updates, messages, display settings, etc.). VISTA WEB administration tool is very easy to operate as it is similar to the VISTA one.

Flight No.	Airline	Departure	Arrival	Status
86-10	AIRFRANCE	15:00	15:15	OK
87-10	AIRFRANCE	15:15	15:30	OK
88-10	AIRFRANCE	15:30	15:45	OK
89-10	AIRFRANCE	15:45	16:00	OK
90-10	AIRFRANCE	16:00	16:15	OK

Display on mobile computers

Data delivered by VISTA WEB can also be displayed on mobile computers, PDAs and smartphones (Apple, Blackberry, Android) for real-time access to information anywhere in the airport.

Integration in the airport environment

VISTA WEB perfectly integrates into the airport network. It supports the TCP/IP communication protocol and receives data dynamically from the real-time program of the Airport Operational Database. Data are displayed on VISTA WEB workstations in any standard web browser. The workstations can be located at other sites (taxi, hotel reception, etc.) and connected to the private airport network (VPN) or to any other remote access network (Internet, etc.).

True to RESA's philosophy, VISTA WEB is an open system which can be used independently from any other software developed by RESA, and can receive information from any AODB available on the market.

Thanks to VISTA WEB, the airport can negotiate a high value-added service with its partners.

Broad access to flight information

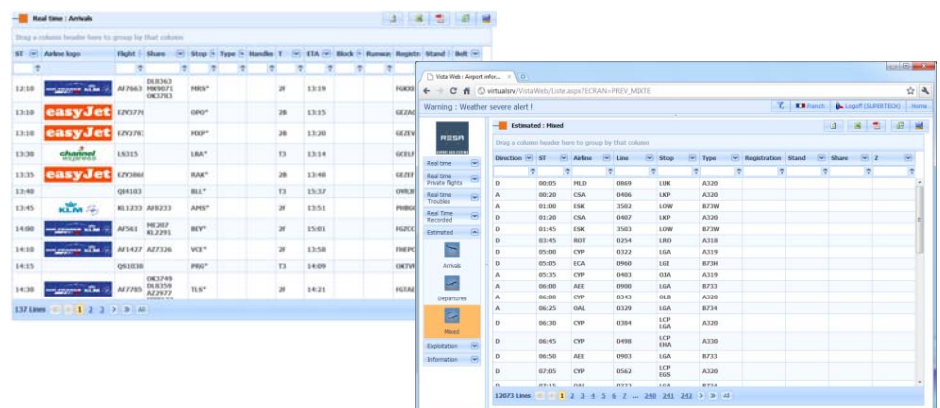

The VISTA WEB solution receives information in real time from the Airport Operational Database. Users can also enter additional information specific to the airport (weather alert, unavailable resources because of works, etc.). Data to display are selected by the administrator according to the needs. Information received from the Airport Operational Database is available succinctly (for experts) or in extensive wording (airline code, name, logo, etc). It is also possible to display data on a large screen in the Airport Operations Center.

The data managed by VISTA WEB can be used for forecasting, operations and informational purposes:

- ≡ list of scheduled flights for the season (display of the flights scheduled for a given date),
- ≡ list of commercial and private flights (cargo, military, etc.) for the current day (departures and arrivals),
- ≡ real-time list of the airport resources in use (check-in desks, boarding gates, parking stands, baggage carousels, exits),
- ≡ list of recorded flights (completed flights no longer in the real-time program),
- ≡ list of commercial flights that are delayed or cancelled,
- ≡ technical messages about the flights,
- ≡ service messages input by the airport (weather reports, construction, etc.) and flash messages scrolling in the upper part of the window,
- ≡ etc.

VISTA WEB offers a number of layout options for information display. The screen is divided into three parts:

- ≡ a top banner, which contains actions shared by all screens,
- ≡ a vertical menu on the left, which is used to browse between screens,
- ≡ a main part, which lists data (flights, schedule, etc.) in a table.

Please feel free to contact us for detailed documentation about VISTA WEB.
