

The billing solution for airports

Key module of the Airport Information System (AODB), INVOICE is a software suite entirely dedicated to airport billing.

A secure system with unlimited settings, INVOICE automates all invoicing operations, including aeronautical services and fees (recurring charges, one-time services, automatic credit notes), and miscellaneous fees and utilities.

A powerful and user-friendly tool

Thanks to its powerful, unlimited invoicing engine, INVOICE is different from other aeronautical billing applications which can only bill for regulated fees.

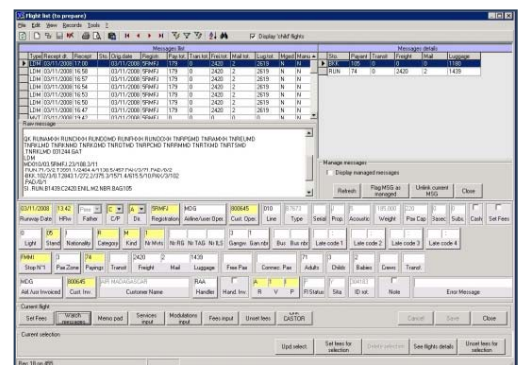

INVOICE enables users to create and modify invoicing rules based on changes in regulations or airport management procedures, via a clear, user-friendly interface. The invoicing rules can process all items constituting a flight.

Data exchanges

INVOICE interfaces with the Airport Information System by receiving upstream flight data in real time for immediate invoicing.

INVOICE also includes an IATA LDM/SLS connection module for automatic movement updates. This interfacing capability maximizes billing automation and productivity.

INVOICE can receive information from CASTOR, RESA's flight traffic and load data collection system, so partners can validate the data before they are integrated, preventing contested invoices.

INVOICE also features an ASSISTANCE module for issuing separate invoices to bill for handling and related services provided during stopovers.

INVOICE is a software suite designed to facilitate and speed up airport invoice processing.

Automated and with unlimited settings, INVOICE facilitates daily billing management and improves productivity.

Key features

Secure billing

Automated imports from the AODB means no manual data entry which can be a source of errors. The imports are done in real time so flight services can be billed in full before departure.

INVOICE avoids double invoicing by comparing operations billed in full with operations billed regularly.

INVOICE ensures accurate billing by enabling users to predefine an unlimited number of fees and one-time or recurring services. No more manual entries that result in omissions or errors.

Electronic invoice management

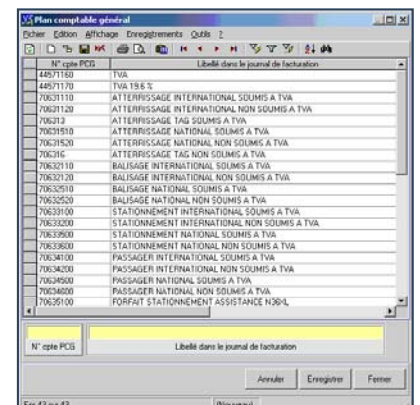

INVOICE issues invoices in electronic format (Acrobat pdf) that can be sent to customers by email to speed airport revenue capture. The invoices can be stored on any airport server for easy processing.

Accounting system integration

INVOICE has tables defining the products and analytical accounts associated with each billed item. After billing, the data are exported to a flat file for use in the central management system and invoice integration in the customer, product and VAT accounts.

INVOICE interfaces with the main standard accounting systems available on the market (LINEAL, ADONIX, COMPTAREL, SAGE, etc.) for automated data imports.

For statistical purposes, INVOICE data can also be exported to other standard business applications and can be accessed with INFOCENTRE tools (BI SUITE, etc.).

Please feel free to contact us for detailed documentation about INVOICE.
